

MVC Revival on the Web

Janko Mivšek

janko.mivsek@eranova.si

@mivsek @aidaweb

ESUG 2013

AIDAweb
Smalltalk Web Application Server

```
self add: self documentTitleElement; add: self documentActionsElement.  
bucketElement := self bucketsElement. "detailed info, references..."  
self add: self infoLineElement. "brief info about document"  
self add: bucketElement. "infoLine needs buckets before"
```

Motivation

- ▶ 30 years of Smalltalk, 30 years of MVC
 - ▶ 34 years exactly, since 1979
- ▶ Hot in JavaScript MVC frameworks
- ▶ For Single-Page and Realtime web apps
- ▶ We Smalltalkers should respect and revive our pearls better

```
self add: self documentTitleElement; add: self documentActionsElement.  
bucketElement := self bucketsElement. "detailed info, references..."  
self add: self infoLineElement. "brief info about document"  
self add: bucketElement. "infoLine needs buckets before"
```

Contents

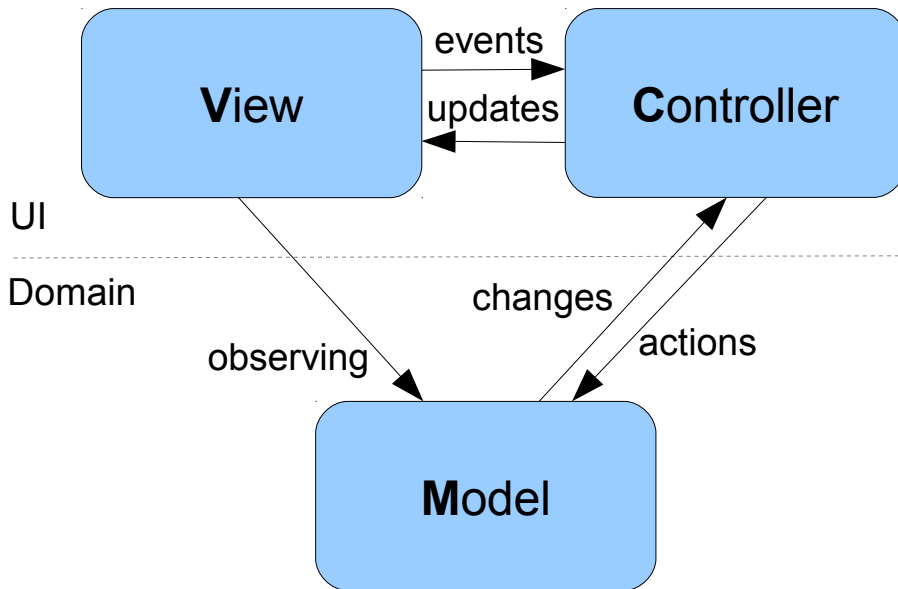

- MVC explained
- History
- Usage in current JavaScript frameworks
- Usage in Smalltalk
- Current and future MVC in Aida/Web

```
self add: self documentTitleElement; add: self documentActionsElement.  
bucketElement := self bucketsElement. "detailed info, references..."  
self add: self infoLineElement. "brief info about document"  
self add: bucketElement. "infoLine needs buckets before"
```

MVC Explained

Architectural design pattern

- Model for domain specific data and logic
- View for presentation to the user
- Controller for interactions with the user and updating domain model

Main benefit:

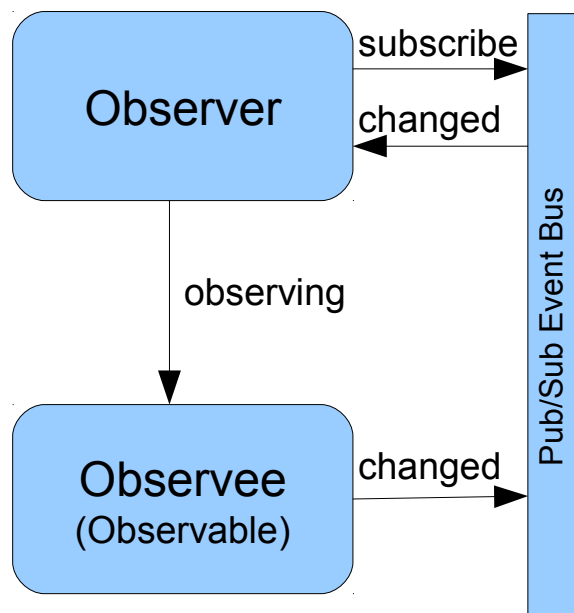

- separation of concerns

```
o add: self documentTitleElement; add: self documentActionsElement.  
bucketElement := self bucketsElement. "detailed info, references..."  
o add: self infoLineElement. "brief info about document"  
o add: bucketElement. "infoLine needs buckets before"
```

MVC based on Observer pattern

- Observer looks at observee
- Observee is not aware of that

Dependency mechanism:

- Observer is dependent on Observee state
- Observee must report state changes to Observer
- Pub/Sub Event Bus decouples Observee from Observer to preserve its unawareness of observation

Main benefit:

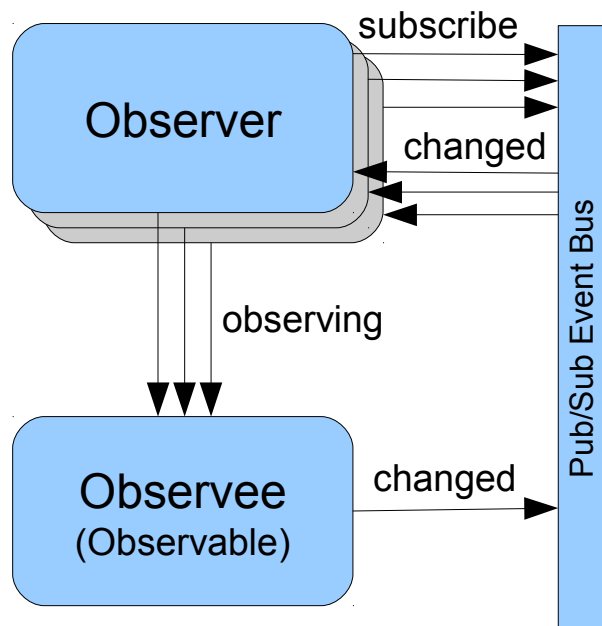

- separation of concerns

```
o add: self documentTitleElement; add: self documentActionsElement.  
bucketElement := self bucketsElement. "detailed info, references..."  
o add: self infoLineElement. "brief info about document"  
o add: bucketElement. "infoLine needs buckets before"
```

Multiple observers

- Multiple observers of the same Observee
- In MVC an Observee is View and Observer is domain Model, therefore:

- many views of the same model
- many apps
- many users
- mix of all three cases

```
o add: self documentTitleElement; add: self documentActionsElement.
bucketElement := self bucketsElement. "detailed info, references..."
o add: self infoLineElement. "brief info about document"
o add: bucketElement. "infoLine needs buckets before"
```

Example: Counter demo in Aida/Web

- ▶ Multiuser realtime web counter example
- ▶ <http://demo.aidaweb.si>
 - click **Realtime** on the left
 - click Decrease or Increase to change counter
 - counter is changed on all other's browsers

```
self add: self documentTitleElement; add: self documentActionsElement.  
bucketElement := self bucketsElement. "detailed info, references..."  
self add: self infoLineElement. "brief info about document"  
self add: bucketElement. "infoLine needs buckets before"
```

History of MVC (1)

- ▶ Invented by Trygve Reenskaug when he worked in 1978/79 with Alan Kay's group on Xerox Parc on Smalltalk and Dynabook
 - Final term Model-View-Controller coined 10. December 1979.

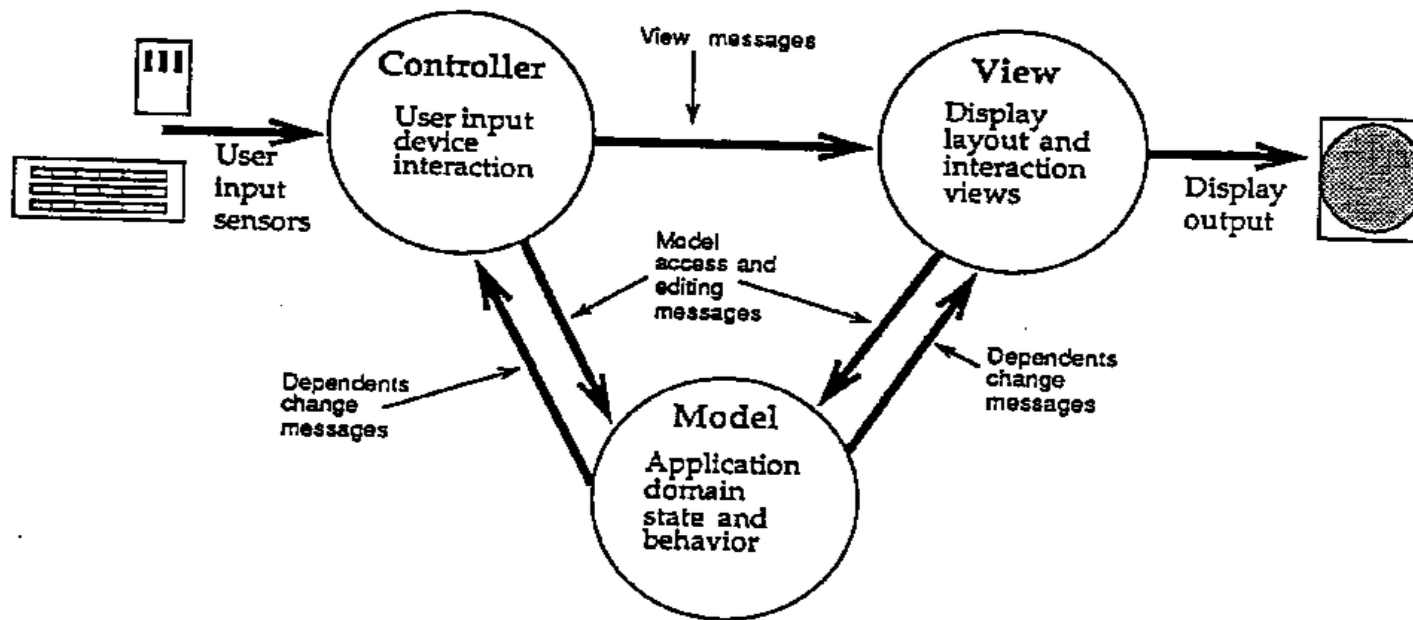

Reenskaug's diagram of MVC basic idea from 2006

```
o add: self documentTitleElement; add: self documentActionsElement.  
bucketElement := self bucketsElement. "detailed info, references..."  
o add: self infoLineElement. "brief info about document"  
o add: bucketElement. "infoLine needs buckets before"
```

History of MVC (2)

MVC State and Message Sending
A Description of the Mode-View-Controller User
Interface Paradigm in the Smalltalk-80 System
Glen E. Krasner and Stephen T. Pope
Parcplace, 1988

```
o add: self documentTitleElement; add: self documentActionsElement.  
bucketElement := self bucketsElement. "detailed info, references..."  
o add: self infoLineElement. "brief info about document"  
o add: bucketElement. "infoLine needs buckets before"
```

History of MVC (3)

▶ 80's

- 1979: invented by Trygve Reenskaug
- Smalltalk-80, VisualWorks by Parcplace

▶ 90's

- NeXTSTEP, OpenStep, Cocoa
- 1996: Aida/Web
- Squeak MVC

▶ 00's

- JSP, Apache Struts, Spring,
- ASP.NET
- Ruby on Rails

▶ 10's

- JavaScript MVC frameworks: Backbone, Ember, Angular, ...

```
self add: self documentTitleElement; add: self documentActionsElement.  
bucketElement := self bucketsElement. "detailed info, references..."  
self add: self infoLineElement. "brief info about document"  
self add: bucketElement. "infoLine needs buckets before"
```

MVC in JavaScript

Backbone.js

- First JS MVC framework

Ember.js

AngularJS

- Supported by Google
- Influences new HTML5 standards
- Dart
- Many ex-Smalltalkers there
- **W3C Web Components**

KnockoutJS

 **TodoMVC**

- JS MVC »playground«
- simple web app to test and compare frameworks
- <http://todomvc.com>

```

@ add: self documentTitleElement; add: self documentActionsElement.
bucketElement := self bucketsElement. "detailed info, references..."
@ add: self infoLineElement. "brief info about document"
@ add: bucketElement. "infoLine needs buckets before"
```

MVC in Smalltalk

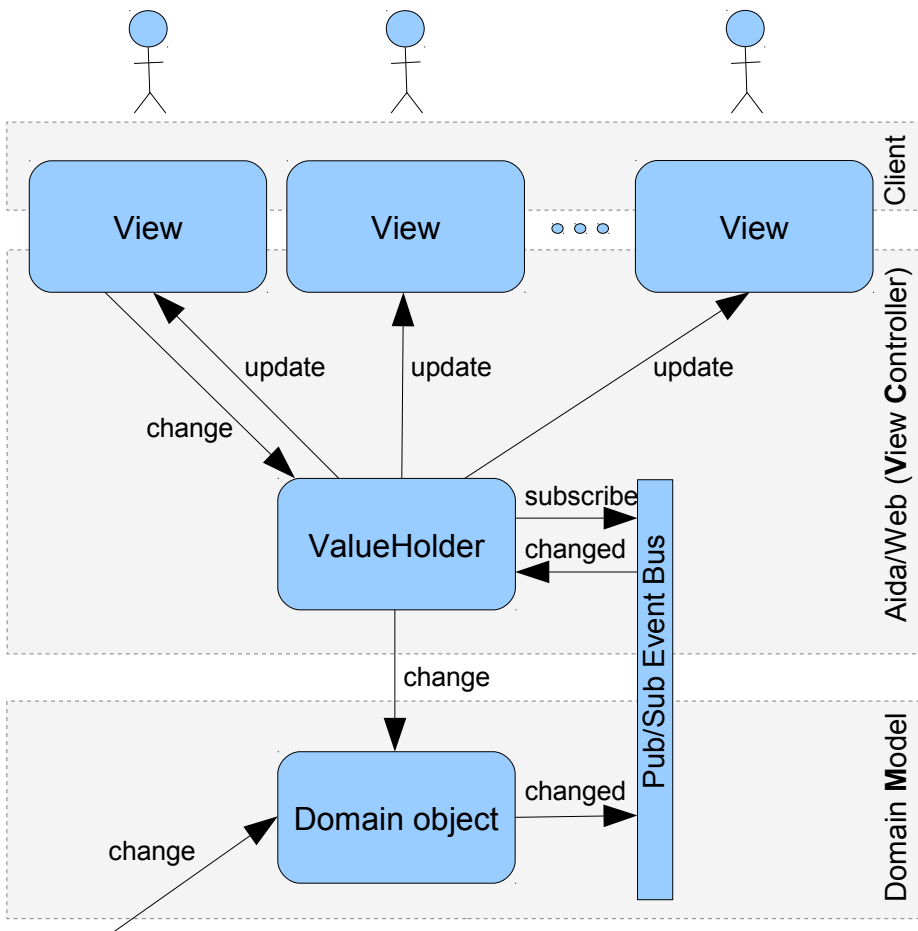

- ▶ Nowadays in use:
- ▶ GUI Frameworks
 - VisualWorks
 - Dolphin (MVP)
- ▶ Web Frameworks
 - Aida/Web

```
self add: self documentTitleElement; add: self documentActionsElement.  
bucketElement := self bucketsElement. "detailed info, references..."  
self add: self infoLineElement. "brief info about document"  
self add: bucketElement. "infoLine needs buckets before"
```

Future MVC in Aida/Web

- Extend dependency mechanism up to the web clients
- auto update when domain object changes
- realtime
- decoupled
- no need for extra code

```

@ add: self documentTitleElement; add: self documentActionsElement.
bucketElement := self bucketsElement. "detailed info, references..."
@ add: self infoLineElement. "brief info about document"
@ add: bucketElement. "infoLine needs buckets before"
  
```

Change detection

```
counter: anInteger
counter := anInteger.
self changed: #counter.
```

- Automatic change detection is needed

- Possible solution:

- Immutability flag as in VisualWorks
- last remaining bit in object header used
- flags an object as immutable (read-only)
- any write attempt raise an exception

```
self beMutable.
...
counter: anInteger
counter := anInteger.
```

exception

Exception handler

```
self beMutable
counter:= anInteger
self beImmutable
self changed: #counter
```

continue

```
o add: self documentTitleElement; add: self documentActionsElement.
bucketElement := self bucketsElement. "detailed info, references..."
o add: self infoLineElement. "brief info about document"
o add: bucketElement. "infoLine needs buckets before"
```

Conclusion

- ▶ MVC is well alive
- ▶ Very usefull for nowadays Single Page Realtime web apps
- ▶ Smalltalk community encouraged to find new ways of using MVC in our apps

```
self add: self documentTitleElement; add: self documentActionsElement.  
bucketElement := self bucketsElement. "detailed info, references..."  
self add: self infoLineElement. "brief info about document"  
self add: bucketElement. "infoLine needs buckets before"
```

Thanks for your attention!

www.aidaweb.si

@aidaweb

```
o add: self documentTitleElement; add: self documentActionsElement.  
bucketElement := self bucketsElement. "detailed info, references..."  
o add: self infoLineElement. "brief info about document"  
o add: bucketElement. "infoLine needs buckets before"
```
